ABSTRACT

ABSTRACT

This website provides Information about Modern Technology and Gadgets and how to use them. Latest information on innovations sourced from experts. Group Discussions and personal messages Troubleshooting information. News about Tech Giants and Innovations

INTRODUCTION

INTRODUCTION

OBJECTIVE:

Since the first industrial revolution, social scientists have called attention to the central role played by technology, in shaping the evolution of organizations, and in affecting the relations among individuals, groups, and the organizations
within which they work. But people are failing to stay updated with the developing technology and not knowing how to use the modern technology.

SCOPE:

The main scope of our website is as follows.

1. To provide information about daily modernizations of technology operating system.
2. To provide information about how to use latest gadgets.
3. To provide information about troubleshooting.
4. To allow newbies to get clear information about the developing technologies.
5. To develop a complete automation solution for a college from scratch.

PROBLEM DEFINITION

PROBLEM DEFNITION

EXISTING SYSTEM:

Most of the websites delay to provide the information about latest innovations. Information is being provided by some websites, but most of it so confusing or false. Members in the existing websites are total new to tech and have no expert guidance. The information providers themselves are partially aware of the innovations. Excrement information about how to troubleshoot.

PROPOSED SYSTEM:

This project is developed so that people can stay updated with daily modernizations of technology and they can learn how to use them. Latest information on innovations sourced from experts. Information about every piece of latest developing gadgets, mobiles, computers and internet. Information about how to use latest gadgets. Information about troubleshooting software and hardware errors. Latest news about TECH GAINTS.

SYSTEM ANALYSIS

SYSTEM ANALYSIS

System analysis is an important phase of any system development process. System analysis is the process of gathering and interpreting facts, diagnosing problems and using the information to recommended improvements on the system. System analysis is a problem solving activity that requires intensive care between system users and the system developers.

The system analysis plays the role of an interrogator and dwells deep in to the working of the present system. Analysis is a detailed study of the various operations performed by a system and their relationships within and outside the system. One aspect of analysis is defining the boundaries of the system and determining whether or not a candidate should consider other related systems. During analysis data is collected from the available files, decision points and transactions handled by the present system.

Logical system models and tools are used in analysis. Training experience and commonsense are required for the collection of the information needed to the analysis.

A detailed study of these process must be made by various techniques like interviews, questionnaires etc. The data collected by the sources must be scrutinized by arrive to a conclusion. The conclusion is an understanding of how the system functions. This system is called the existing system.Now the existing system is subjected to close study and the problem areas are identified. The

designer now functions as a problem solver and tries to sort out the difficulties that the enterprises faces. The solutions are given as a proposal. The proposal then weighted with the existing system analytically and the best one is selected. The proposal is presented to the user for an endorsement by the user. The proposal is reviewed on user request and suitable changes are made. This loop ends as soon as the user is satisfied with the proposal.

REQUIREMENT ANALYSIS:

Requirement analysis is a software engineering task that bridges the gap between system level software allocation and software design. It provides the system engineer to specify software function and performance indicate software's interface with the other system elements and establish constraints that software must meet.

The basic aim of this stage is to obtain a clear picture of the needs and requirements of the end-user and also the organization. The analysis have to uncover the real needs of the user even if they don't know them clearly.

During analysis it is essential that a complete and consistent set of specifications emerge for the system. Here it is essential to resolve the contradictions that could emerge from information got from various parties.This is essential to ensure that the final specifications are consistent.

It may be divided into 5 areas of effort.

1. Problem recognition.
2. Evaluation and synthesis.
3. Modeling.
4. Specification.
5. Review.

Each requirement analysis method has a unique point of view. However all analysis methods are related by a set of operational principles. They are:

1. The information domain of the problem must be represented and understood.
2. The functions that the software must be defined.
3. The behavior of the software as a consequence of external events must be defined.
4. The models that depict information function and behaviour must be partitioned in a hierarchical or layered fashion.
5. The analysis process must be moved from essential information to implementation details.

SYSTEM MODULES:

System modules are similar to the user guide for operating the application. The fields which are available in the application and how to use them in the application needs to be known to usage. When the application has opened there exists different options to perform, if the application is new in market the designer should also give a details of using the application to the customers.

SYSTEM REQUIREMENT SPECIFICATION

Software requirement specification plays an important role in creating quality software solutions Specification is basically a representation process. Requirements are represented in a manner that ultimately leads to successful software implementation.

The term system requirements have two meanings, first, it can refer to the requirements that describe the capabilities of the system with which, through which, and on which the product will function. System requirement specification plays an important role in creating quality software solutions.

There are two categories of system requirements. Functional requirements specify what the system must do. Performance requirements specify the acceptable level of user performance and satisfaction with the system.

SYSTEM REQUIREMENTS

SOFTWARE REQUIREMENTS:

Web Server	-	Apache Http Server
Database	-	MySQL
Web Technologies	-	HTML, CSS, Java Script, PHP
Operating System	-	Windows XP or higher
Browsers	-	Mozilla Firefox, Google Chrome

HARDWARE REQUIREMENTS:

Processor	-	Intel Pentium series or higher
Memory	-	1 GB RAM or greater

CONCLUSION

The project report entitled “DIGITAL SPACE” has come to its final stage. The system has been developed with much care that it is free of errors and at the same time it is efficient and less time consuming. The important thing is that the system is robust we have tried our level best to make our Information website easily accessible for all.

It was a wonderful learning experience for me while working on this project. This project took me through the various phases of project development and gave me real insight into the world of software engineering. The joy of working and the thrill involved while tackling the various problems and challenges gave me a feel of developer’s industry. It was due to this project I came to know how professional software’s are designed. I enjoyed each and every bit of work I had put into this project. The project is further extendable
